

WHY IT MATTERS

Your tools don't talk to each other. Attackers count on that. The gap between two well configured products is often wider than the gap inside either one.

WHERE INTEGRATION FAILS

01 Blind Handoffs

An event flagged by one tool never reaches the next, so the response that should follow automatically never happens.

02 Siloed Logs

Each tool keeps its own record, in its own format, so no one has the full picture until someone manually pieces it together, often too late.

03 Delayed Response

Without a shared trigger, a real incident waits on a human to notice, correlate, and act, and that delay is exactly what an attacker is counting on.

HOW WE SUPPORT YOU

Design	Operate	Mature
We map how signals move between your tools today, and design the handoffs and shared triggers that should exist but don't yet.	We keep integrations tested and monitored on a real cadence, so an alert in one tool reliably reaches the next.	We extend integration as you add tools, only when the business is ready to sustain the added complexity.

CLOSING THE GAPS BETWEEN TOOLS

Individually strong tools don't add up to a strong posture unless they're integrated. We assess how your stack hands off signals today, close the gaps between products, and make sure an alert in one place triggers the right response everywhere else.
