

WHY IT MATTERS

Most businesses assume their IT support already covers security. Some find out otherwise the hard way. The difference usually comes down to whether your systems are actively defended, or simply kept running.

WHERE IT SUPPORT STOPS AND SECURITY STARTS

01 Monitoring

IT support fixes what breaks when someone reports it. Security actively watches for threats around the clock, whether anyone reports them or not.

02 Response

A helpdesk ticket gets logged and queued. A live security incident needs an immediate, practiced response, not a place in a queue.

03 Ownership

Keeping systems patched and running is a maintenance task. Reducing your attack surface is a strategic responsibility, and it needs an owner.

HOW WE SUPPORT YOU

Design	Operate	Mature
We map what your current IT support already covers, and design a plan to close the security gaps it was never built to handle.	We keep monitoring, response, and defences active day to day, so security isn't something that only gets attention after something goes wrong.	We extend coverage as your firm grows, adding frameworks and oversight only when the business is ready to sustain them.

READY BEFORE THE GAP IS FOUND

Closing a security gap after it's exploited costs far more than closing it before. We assess where your IT support ends and security needs to begin, and close the gaps while it's still your choice to do so.
